

Generico TP6

$$\text{Norm CD}(-\infty, x, s, M) = P$$

↓  
?

$$s = \sqrt{V}$$

↓  
?  
.

$$X M V \rightarrow P$$

$$P M V \rightarrow X$$

$$X M P \rightarrow V$$

$$\left( \frac{x - \mu}{z} \right)^2 = s^2$$

$$P X V \rightarrow M$$

a matéria é tão simples  
tão simples, que os  
professores tem que  
ser tão fracos tão  
fracos para os alunos  
não perceberem.

$$\Phi^{-1}(P) = Z$$

$$\text{Norm CD}(-\infty, x, s, M) = P$$

$$\frac{x - \mu}{s} = z$$

$$-\mu = z \times s - x$$

$$\mu = x - z \times s$$

PMJ

Resumo! Estadística

$P \rightarrow Z_0$

PMJ can also do IC  
by making  $\frac{\alpha}{2} = \alpha$

$$Z_0 = \text{InvNormCD}(P)$$

$$E = Z_0 \times \sqrt{\sigma^2}$$

$$A = M - E$$

$$B = M + E$$

— || —

XJP

$P \rightarrow Z_0$

$$E = Z_0 \times \sqrt{\sigma^2}$$

$$X \rightarrow M = X - E$$

$$Z_0 = \text{InvNormCD}(P)$$

— || —

XMP

$$\begin{matrix} X \\ M \\ \sigma \end{matrix} \rightarrow Z_0 = \frac{X - M}{\sqrt{\sigma^2}} \rightarrow P = \text{NormCD}(-99999, Z_0)$$

— || —

XMP

$P \rightarrow Z_0$

$$Z_0 = \Phi^{-1}(P)$$

$$\begin{matrix} X \\ M \end{matrix} \rightarrow D = \frac{X - M}{Z_0} \rightarrow \sigma = D^2$$

— || —

ICP

N

$$A = \alpha$$

F

$$Z_0 = \text{InvNorm}(1 - (A/2))$$

$$E = Z_0 \times \frac{\frac{F}{N} \times (1 - \frac{F}{N})}{N}$$

$$A = \frac{F}{N} - E$$

$$B = \frac{F}{N} + E$$
